

Discussion of  
Monetary Policy: Conventional and  
Unconventional

Michael Woodford and Stephanie Schmitt-Grohe

Emi Nakamura  
Columbia University

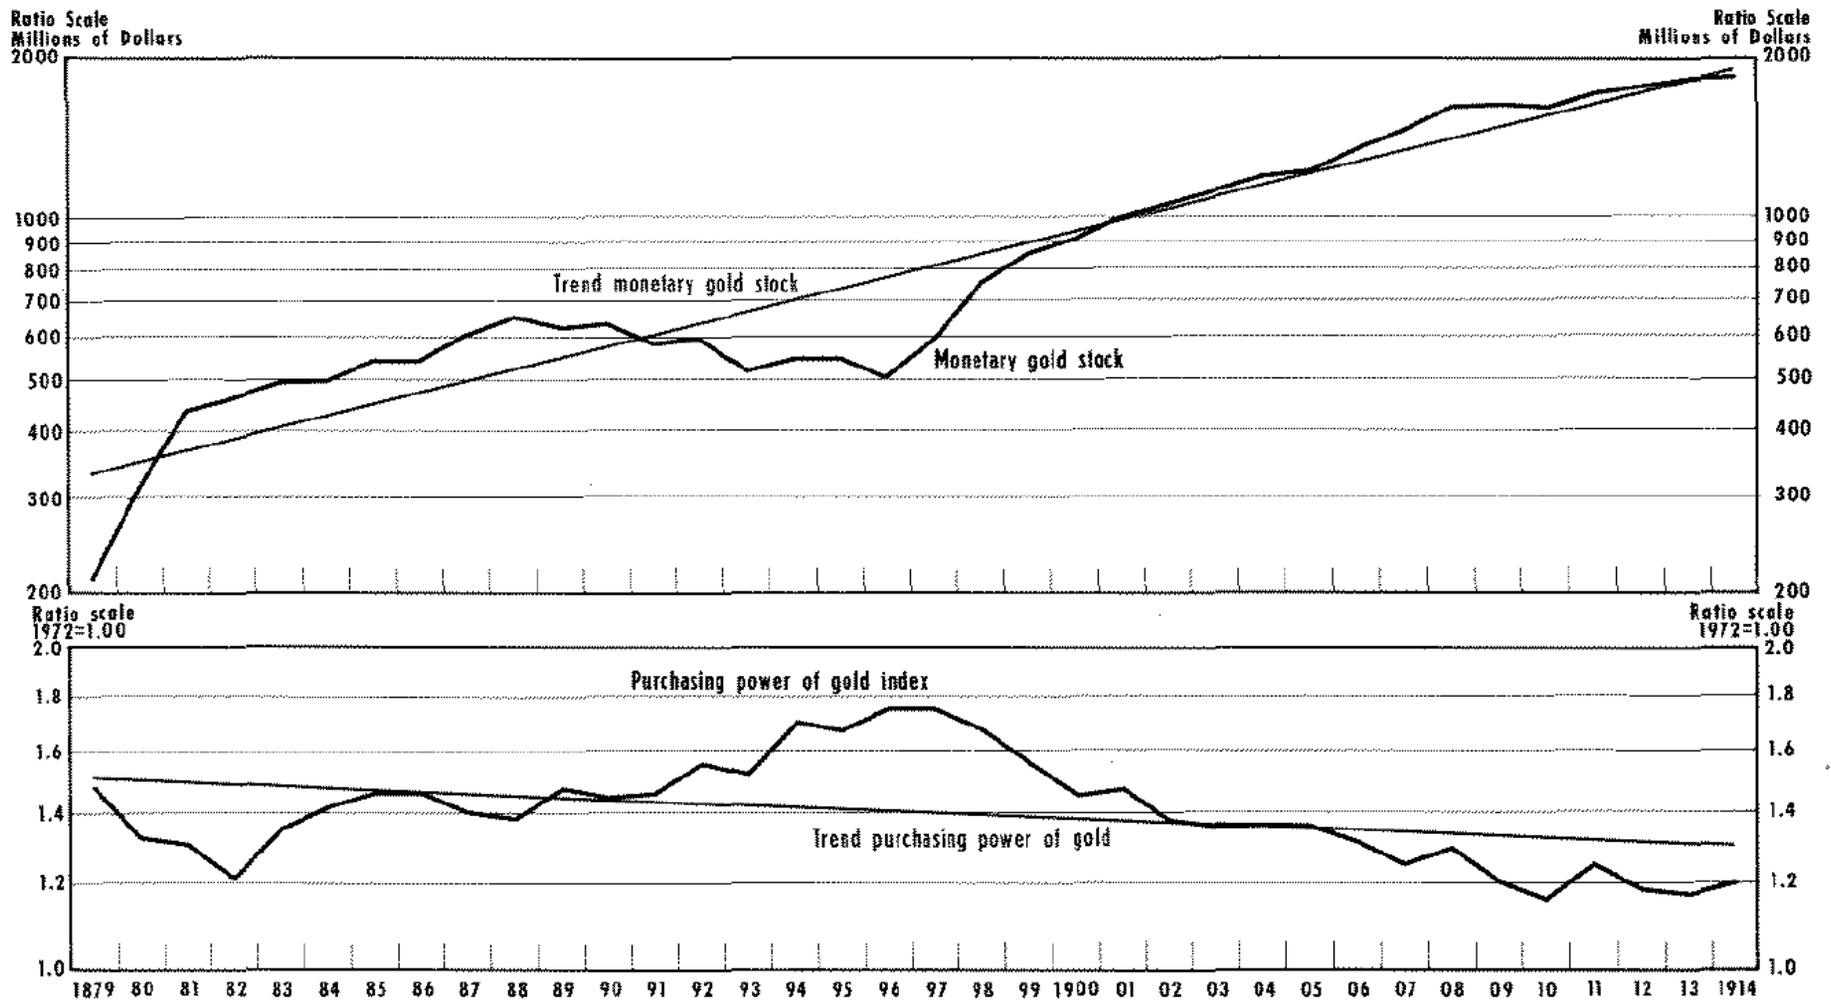

## Monetary Policy Since End of Bretton Woods

- Dramatic changes in monetary policy since end of Bretton Woods
  - Inflation targeting
  - ZLB, QE (and so on)

Perhaps less emphasized are dramatic changes in more basic ideas:

- Is monetary policy about money?
- Do interest rate rules work

# Classical Gold Standard

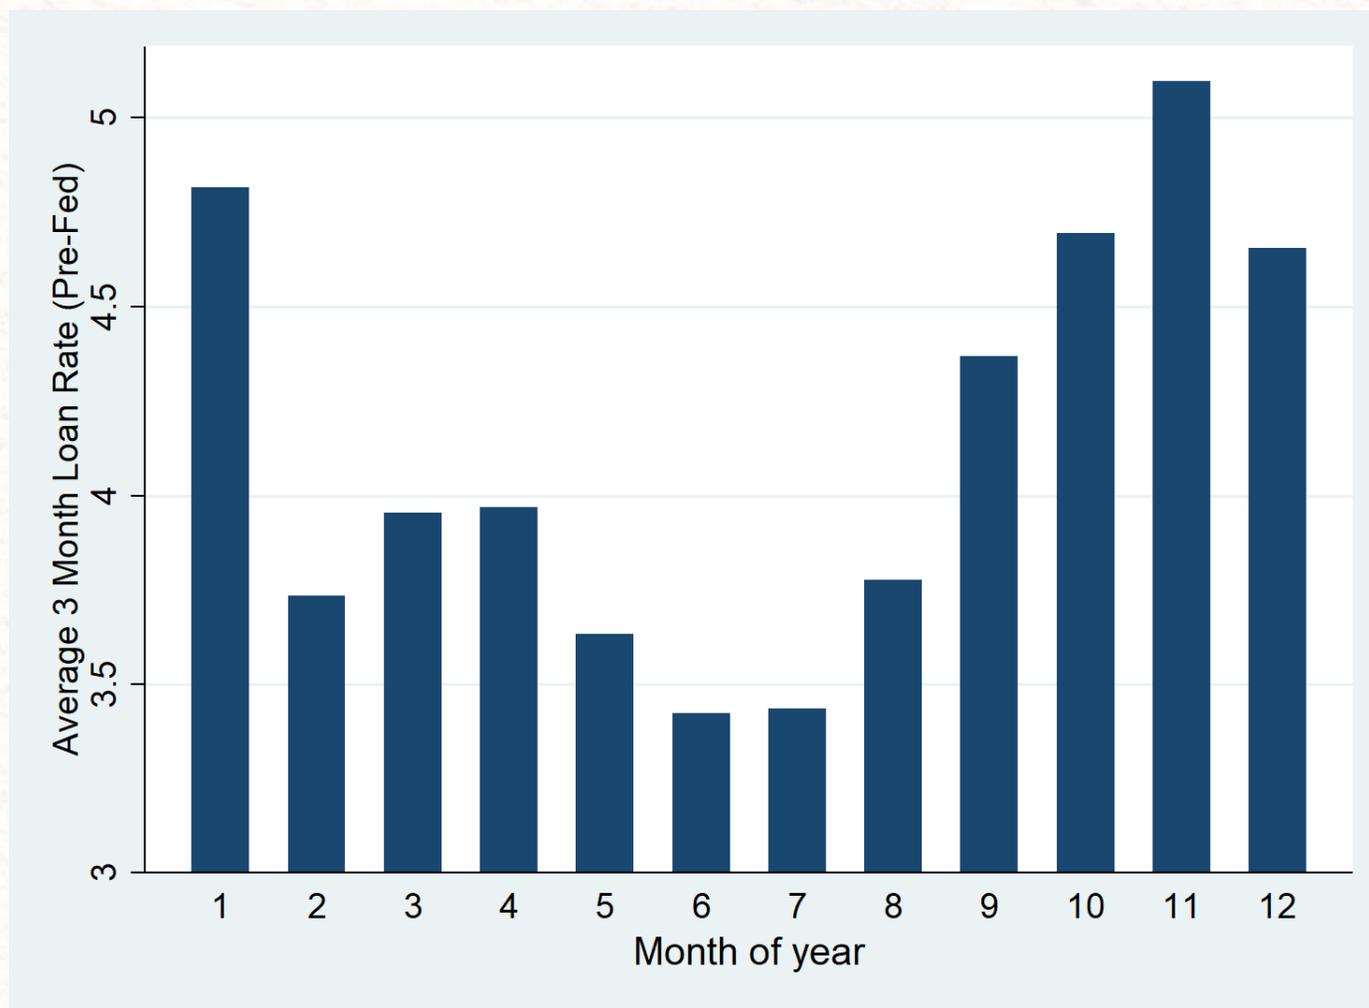

Source: Bordo (1981)

## Money Demand Shocks

- Money demand shocks are HUGE!
- Seasonality:
  - Money demand is high around Christmas
  - Money demand is high at the end of the month
  - Money demand is high in harvest/planting season (in an agricultural economy)
- Financial innovation: Credit cards vs. cash
- Suboptimal to have these factors influence interest rates

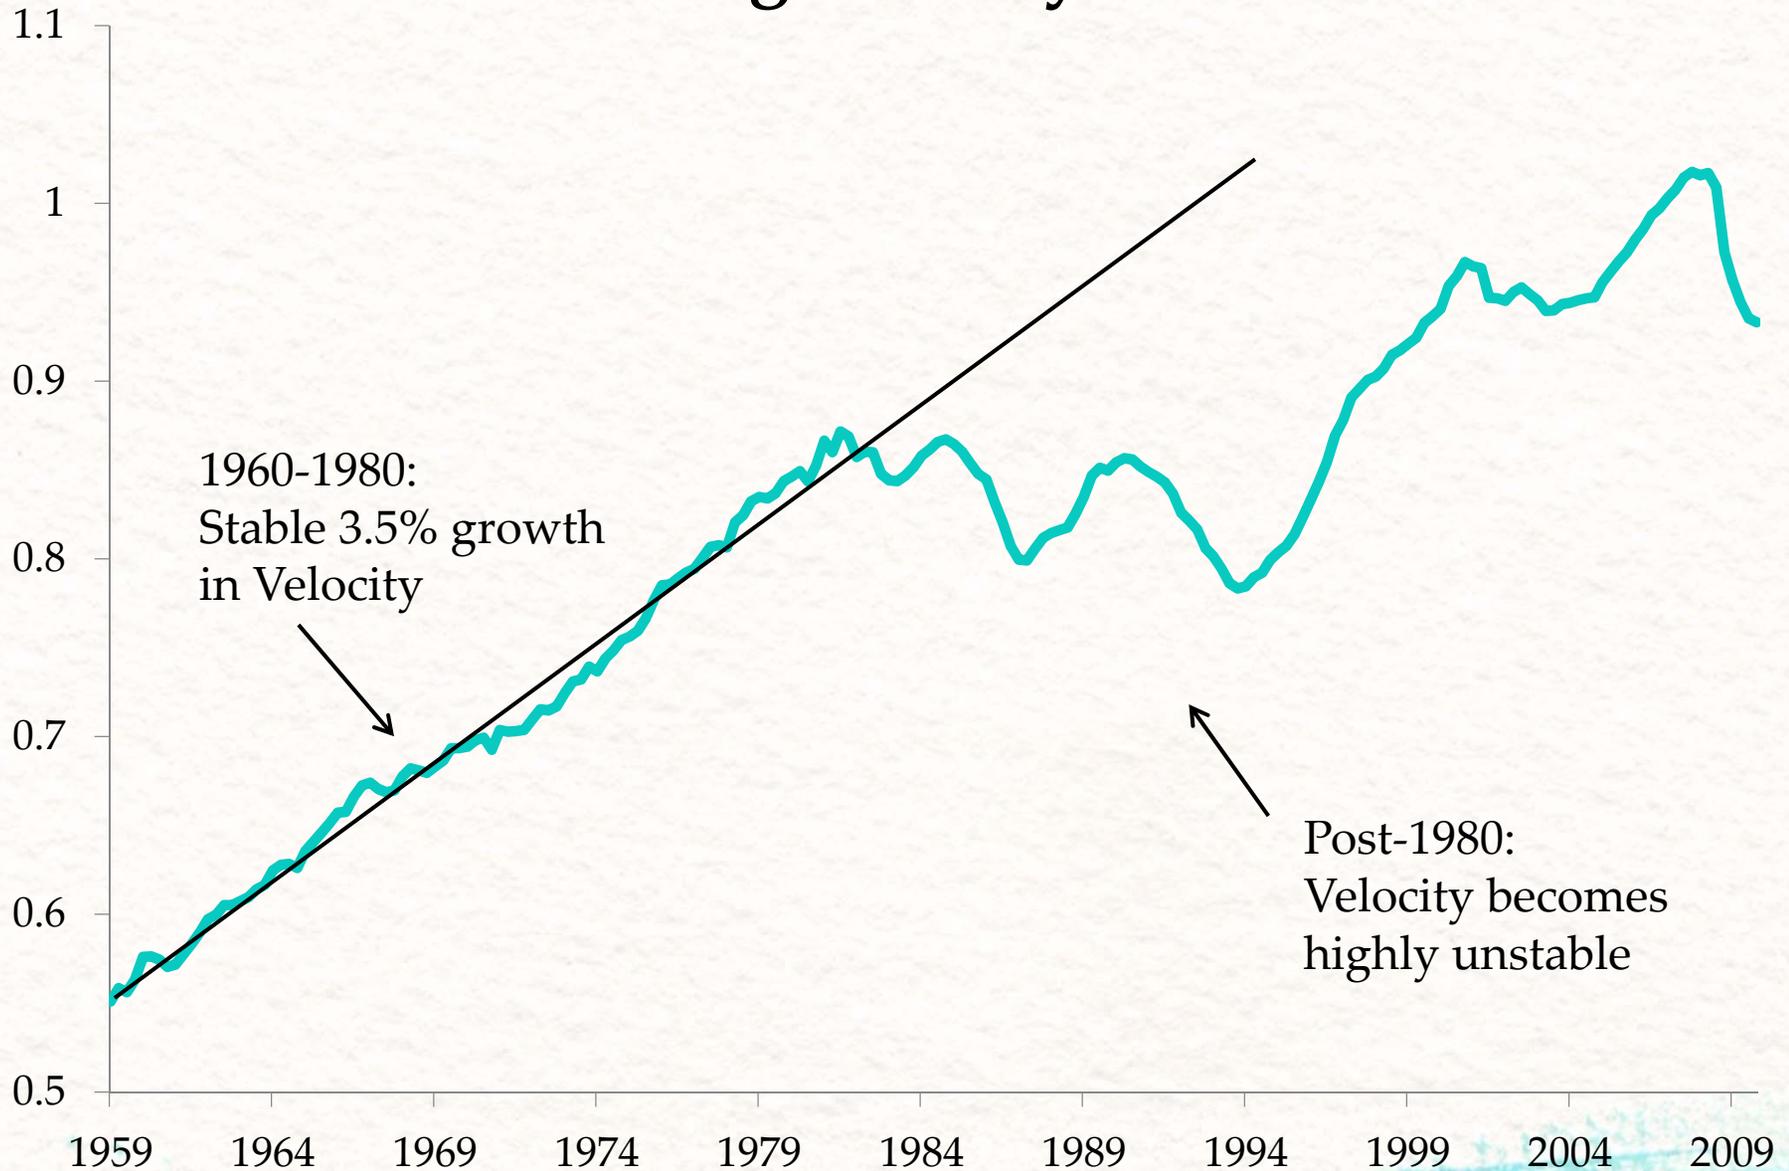

*Big practical issue*

# Seasonal Interest Rates during Gold Standard (1890-1910)

Source: Mankiw, Miron, and Weil (1987)

# U.S. Log Velocity of M1

1960-1980:  
Stable 3.5% growth  
in Velocity

Post-1980:  
Velocity becomes  
highly unstable

## Interest Rate Targeting

- Serious theoretical debate about whether targeting interest rates would wreak havoc on economy

Sargent and Wallace (1975) argued that targeting interest rates would lead to indeterminacy with rational expectations:

“We compare two alternative strategies ... One is to **peg the interest rate ... letting the money supply be whatever it must be to satisfy demand**. The other is to set the money supply period by period, accepting whatever interest rate equilibrates the system.”

## Cowboy Monetary Policy

- Canada and Australia switched to explicit interest rate targeting (channel/corridor system) in mid 1990's
- Eliminated reserve requirements (dramatic decline in money demand)
- Contrast vs. academic work (largely still focused on money)
- Much more explicit about  $i$  as policy instrument than earlier monetary policies

## IS-LM

- Monetary policy is about trade-off between interest-dominated *money* and interest-bearing bonds
- Central bank determines interest rates through *open market operations*
- Print money to buy bonds (so money and interest rates are negatively correlated)

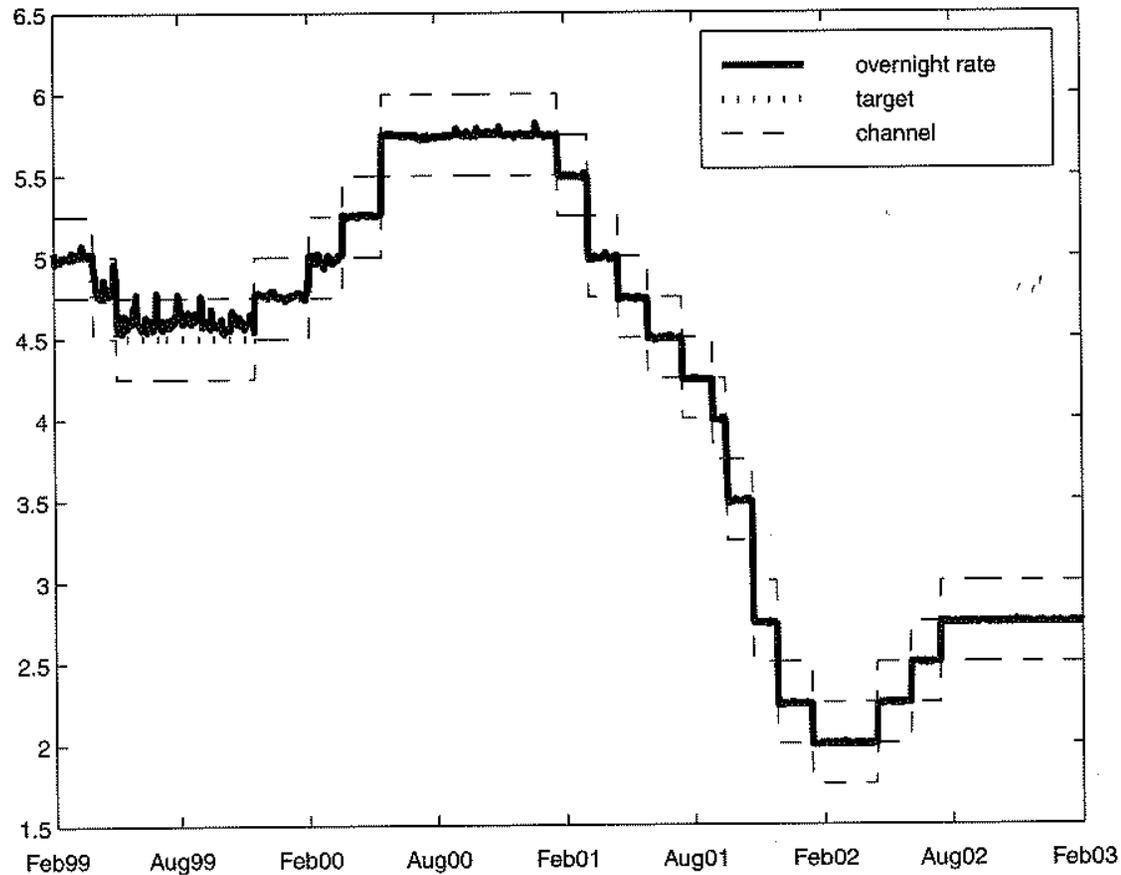

## Corridor system

- Central bank chooses a **narrow corridor** around target overnight interest rate  $i$
- Stands ready to supply an **arbitrary amount** of reserves at  $\bar{i}$  and to take arbitrary deposits at  $\underline{i}$
- “Open market operations” trading off “money” and “bonds” play at most a secondary role
  - Reserves now bear interest
  - Open market operations only serve to position interest rates within the (narrow) corridor
  - Central bank supplies cash to offset money demand shocks (Christmas, credit cards, etc.)

# Did it Work? Canada

## 3. Monetary Policy without Control of a Monetary Aggregate

## No Longer Experimental

- This “cowboy” approach to central banking is now the industry standard
  - Canada and Australia followed by New Zealand, ECB, Bank of Japan, Bank of England, Bank of Korea, and so on...
- Fed: “Floor” system
  - Interest on reserves since late 2008
  - Enough reserves to push interest rate to the “floor” of the corridor

## Fortunately, Theory has Caught Up

- Cashless economy  
(Woodford 2000, 2001, 2003)
- Price level determinacy using interest rate rules
  - Taylor principle (McCallum, Woodford)
  - Commodity trigger rules (Obstfeld/Rogoff, Woodford)
  - Fiscal theory (Woodford, Cochrane, Sims)
  - Learning (Evans-Honkapohja)
  - K-level thinking (Garcia-Schmidt and Woodford)

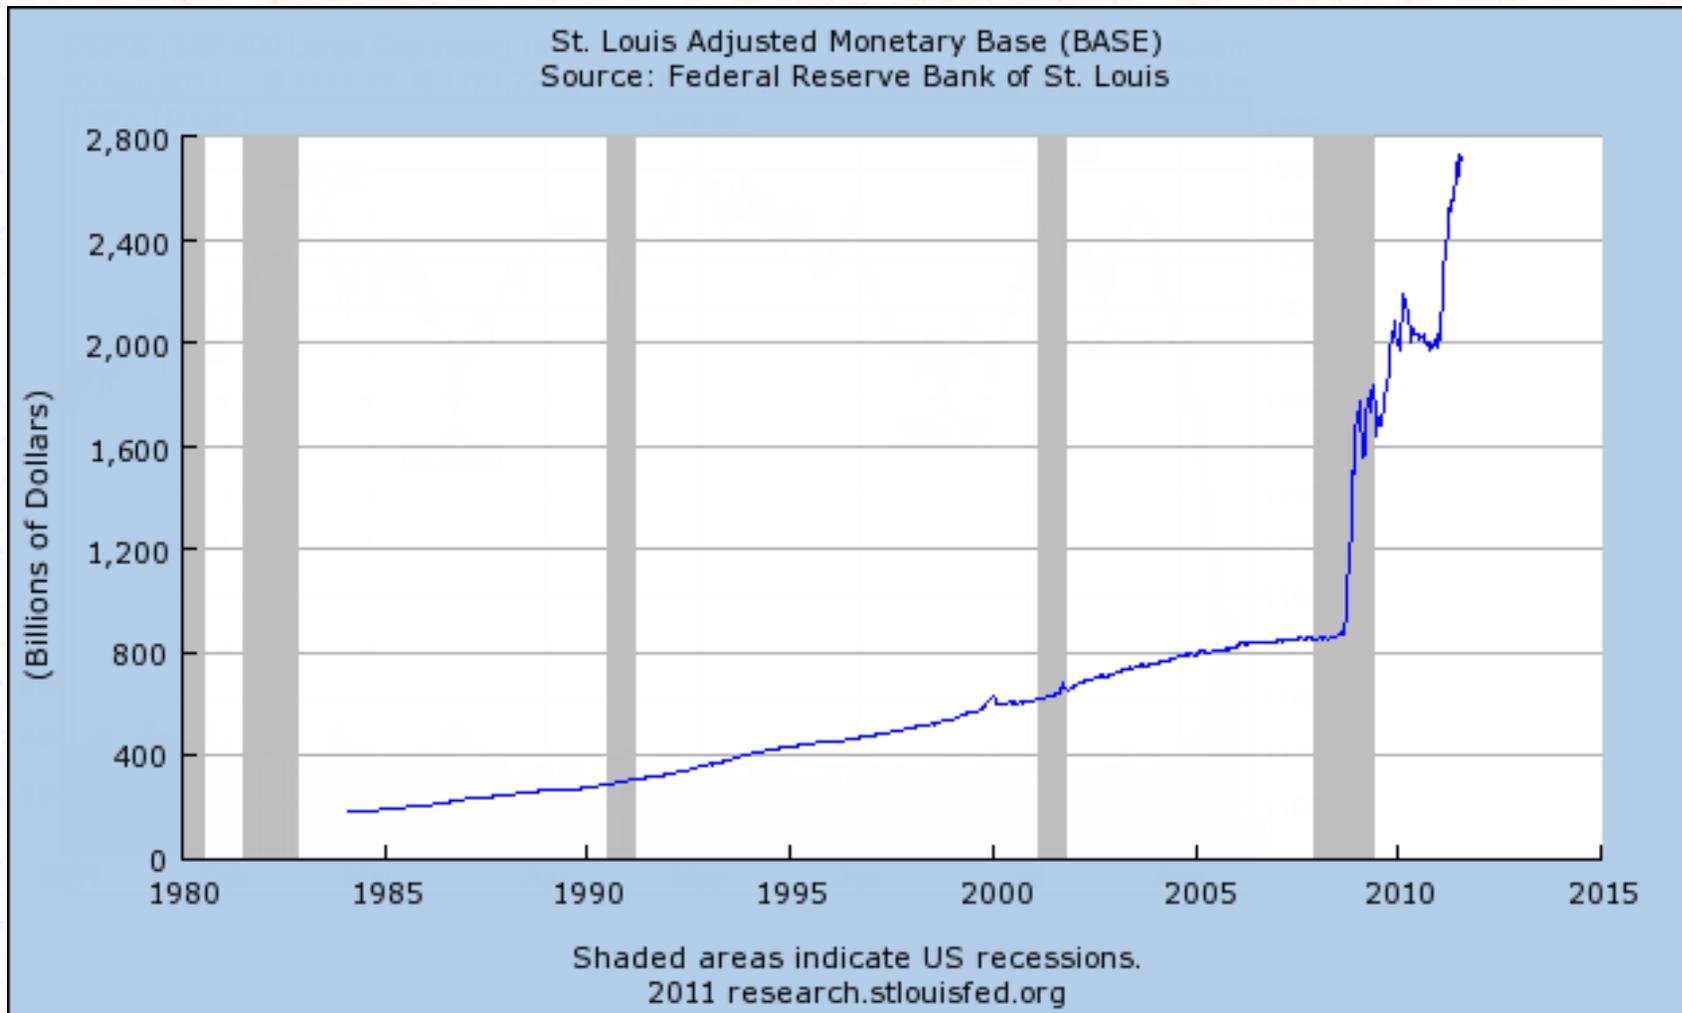

# Empirics: Money to interest rates

Barro (1977)	Money
Sims (1980)	Money

Gurkaynak Sack and Swanson (2005)	Interest Rates
Gertler and Karadi (2015)	Interest Rates
Nakamura and Steinsson (2018)	Interest Rates

## Should we Call it Monetary Economics?

- What is special about the Fed, if not its unique ability to “print” money?
- Cashless theory says key power of Fed is to set interest rates in the “unit of account”
- Strong discontinuity-based evidence that:
  - Nominal exchange rates affect real rates  
(e.g., Mussa; Burstein, Eichengreen and Rebelo)
  - Nominal interest rates affect real rates  
(e.g. Hanson and Stein; Nakamura and Steinsson)
- This alone gives the Fed power  
(Woodford, 2003)

# Practical Implications during Great Recession

## Monetary Plumbing and the Great Recession

- Why didn't monetary economists fear a hyperinflation?
- Remember the plumbing
  - Fed started paying interest on reserves almost simultaneously with the dramatic increase in M0 (for the purpose of expanding credit facilities)
  - Interest on reserves / ZLB increased demand for money (bank reserves no longer interest dominated)
  - Not surprising that M0 skyrocketed
  - No reason to fear hyperinflation
- Monetary economists right for the right reasons
